

*WAITING FOR UNRESPONSIVE EXAMPLE.NET  
> 3-5 SECONDS AFTER STARTING TO LOAD EXAMPLE.COM*

OPTION 0  
OPTION 1  
OPTION 2  
OPTION 3  
OPTION 4

UX Team Recommendation: Option 4, with option 2 as alternative.

- Option 1 risks that the user thinks it's waiting for Firefox, not the site.
- Option 2 is acceptable (and #2 choice), but uninformative.
- Option 3 is misleading, since you're actually waiting for a different site.
- Option 4 is preferred since it's showing exactly what site you're waiting for.
- Option 5 (not shown) could be to show full address to resource.

# CONNECTING TO UNRESPONSIVE EXAMPLE.COM

UX Team Recommendation: Keep as-is.

**ATTEMPTING TO CONNECT TO UNRESPONSIVE EXAMPLE.NET AS PART OF THE PAGE AT EXAMPLE.COM**  
— MESSAGE APPEARS AFTER > 3-5 SECONDS FOR THAT PARTICULAR RESOURCE

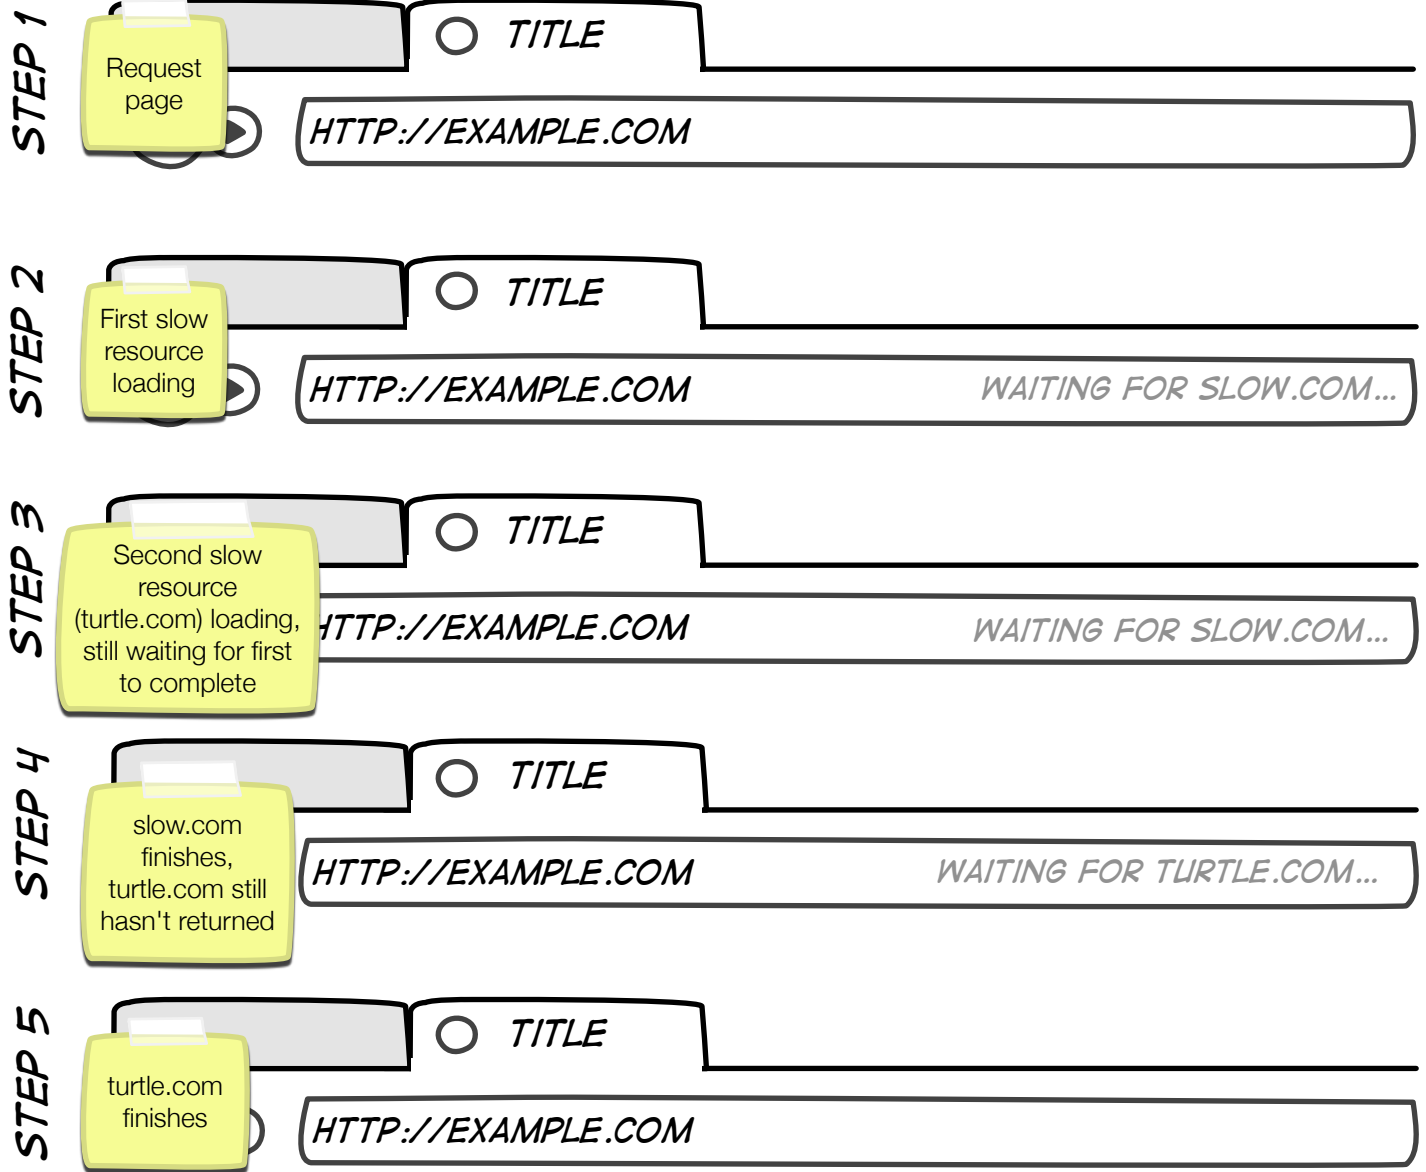

OPTION 1  
OPTION 2  
OPTION 3  
OPTION 4

UX Team Recommendation: Option 4, with option 2 as alternative.

- Option 1 risks that the user thinks it's waiting for Firefox, not the site.
- Option 2 is acceptable, but slightly more misleading in this case than for "Waiting..."
- Option 3 is misleading, since you're actually waiting for a different site.
- Option 4 is preferred since it's showing exactly what site you're waiting for.
- Option 5 (not shown) could be to show full address to resource.

**MULTIPLE SLOW RESOURCES ON PAGE EXAMPLE.COM  
REQUESTED IN PARALLEL: SLOW.COM, TURTLE.COM  
SHOWN AFTER > 3-5 SECONDS OF WAITING  
FOR THAT PARTICULAR REQUEST**

Principle: Show request we're waiting for in the order they come in, but don't change mid-flight once a resource has started loading. If another resource is being slow after the first one finishes, transition to indicating that one — if not, clear the indicator.
